

# Patchouli

## Irrigation

For getting good yield of the crop, the area should receive good and evenly distributed rainfall, because it does not do well under rainfed conditions. Immediately after transplanting the field must be irrigated every day for the first 3 to 4 days and subsequently on alternate days for 10 to 15 days. After three weeks irrigation once or twice a week depending on the type of soil and climate is considered sufficient. The crop is highly susceptible to water logging.
