Manuring & Fertilization

The fertilizer dose depends upon the fertility of soil and amount of organic manure applied to the crop. For a good yield, 15-20 tonnes of well-decomposed FYM is incorporated into the soil about 4 weeks before transplanting. Generally, application of 80-120 kg N, 60-100kg P₂O₅ and 60-120 kg K₂O is recommended for optimum yield. Half the dose of N and entire amount of P and K is given at the time of transplanting. The balance N is given six weeks after transplanting or at the time of earthing up. Top dressing should be applied in bands and after each application earthing up of plants is necessary.
