Weed control

It is necessary to keep the crop weed free during the first 20-25 days of plant growth. A total of 3 to 4 weeding are needed. The first weeding is done when the seedlings are two weeks old and subsequent weeding are done at an interval of 25 days.

Pre-emergence application of Basalin 48 EC (1.5kg a.i./ha) or Stomp 30 EC (0.75 kg a.i./ha) followed by one hand weeding at 20-25 days after sowing effectively controls the weed growth.
